SUCTION UNIT

Suction is developed by two carbon brushes by-pass motors which are activated by independant switches placed on a solid, metallic head. Special noise buffers reduce the noise within the safety work standards.

FILTER UNIT

An electro-mechanical level system detects the level of liquid in the container and stops the suction process when maximum level is reached.

COLLECTION UNIT

The vacuum unit is mounted on a robust metal structure, fitted with resistant industrial wheels ideal for mobile service on uneven surfaces.

The container is compact and extractable and contains a sieve grid which separates solid particles from liquid.

OPTIONALS

- ✓ PPL 100 micron filter for ultra fine filtration
